

Airbag Dainese D-air® Ski

The Dainese D-air Ski system is an electronically activated airbag used in alpine skiing competitions. Through accelerometers, gyroscopes, and GPS, it monitors trunk dynamics up to 1,000 times per second and, in the event of an accident, activates the compressed-gas cartridges within a few milliseconds, rapidly inflating the airbag.

Accelerometer

Gyroscope

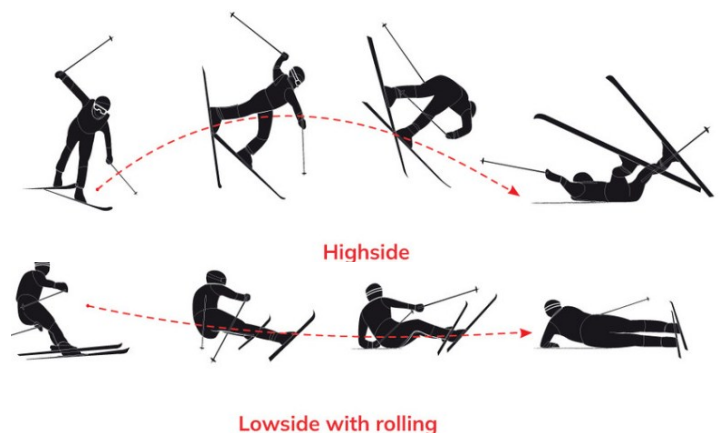

GPS

Designed for Downhill and Super-G, it protects the vital areas of the torso and, from the current season, has become a mandatory device in official competitions.

D-air Ski: frontal airbag and passive rear protection

Recognizable falls detected by the device's intelligent algorithm
