

END-OF-LIFE SKIBOOT RECYCLING

Nowadays the **3,5 million pairs of ski boots** produced yearly worldwide are entirely made of virgin materials and landfilled after 3/5-year use.

This means:

- **9,4 million kg of virgin raw materials** used for new ski boot production;
- **approx. 9 million of kg** of post-consumer ski boots **sent to disposal** as waste
- 33.800 tons of greenhouse gas emissions, expressed in CO₂ equivalent, released in producing virgin materials.
- 963.000 GJ of oil and natural gas be required as feedstock and fuels to produce virgin raw materials.

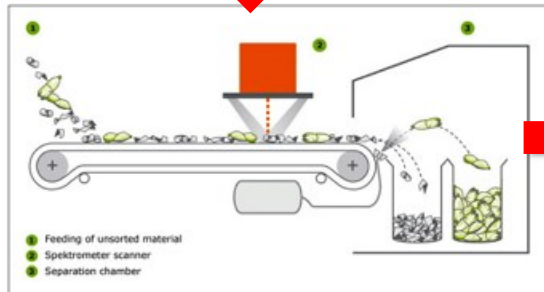

End-life skiboots

grinder

Grinded mixed materials

Triboelectric/NIR/metal sorting

Secondary raw material

New skiboot

2000 skiboots have been produced using end-of-life boots

HELMET RECYCLING

End of life helmets

ABS

EPS

PC

We use bio-based solvent such as Limonene (obtained from citrus fruits) for the recycling of helmets. A plant for the recycling of 5000 helmets a year will start operating in 2026.
