

Innovative sensorized ski boot with strain and load sensors

DAHU boot: A ski boot of innovative design with a rigid outer shell, two buckles, openable for easy entry, and a soft, removable inner liner for walking to the slope, which is then inserted directly into the shell for skiing.

Strain and Load Sensors: Strain gauge bridges have been applied to the points of greatest stress on the shell and on the rear LINK, which is responsible for the FLEX INDEX and shell opening.
